# Testing

A.ASIK RAJA M.sc.,

# Introduction

- ☑ Initially : Testing is the process of executing program with intent of finding errors
- ☑ Finally : Testing is the process of demonstrating that errors are not present.
- ☑ When you test a software, that testing raise the quality/reliablity of software. It mean finding and removing the errors.
- ☑ Therefore, don't test a software to show that it works; rather, you should start with the assumption that the software contains error and then test the software to find as many of the errors as possible.

# Why Testing?

- ☑ To find and correct defects
- ☑ To check whether the client need are satisfied
- ☑ To avoid user detecting problems
- ☑ To provide quality product

# Why does software have bugs?

- ☑ Miscommunication or No communication
- ☑ Time pressure
- ☑ Changing requirements
- ☑ Software complexity
- ☑ Programming mistakes

# Terms

- ☑ Errors : Human actions that produce incorrect result
- ☑ Bug : The presence of error at the time of execution
- ☑ Fault : State of software caused by error.
- ☑ Failure : Deviation from its expected result. It is the event.

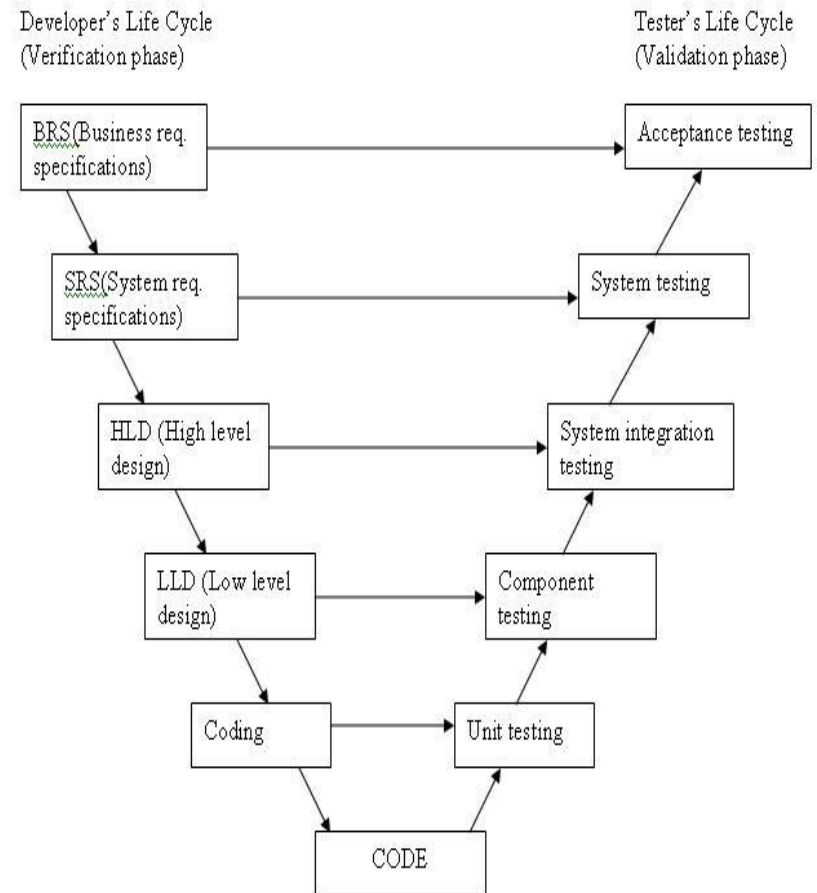

# **Where is Testing in methodologies?**

# In Waterfall,

- ☑ Analysis
- ☑ Design
- ☑ Implementation
- ☑ Integration and **Testing**
- ☑ Deployment
- ☑ Maintenance

# V-Model

- ✓ It is an SDLC model where execution of processes happens in a sequential manner in a V-shape
- ✓ Also known as Verification and validation method

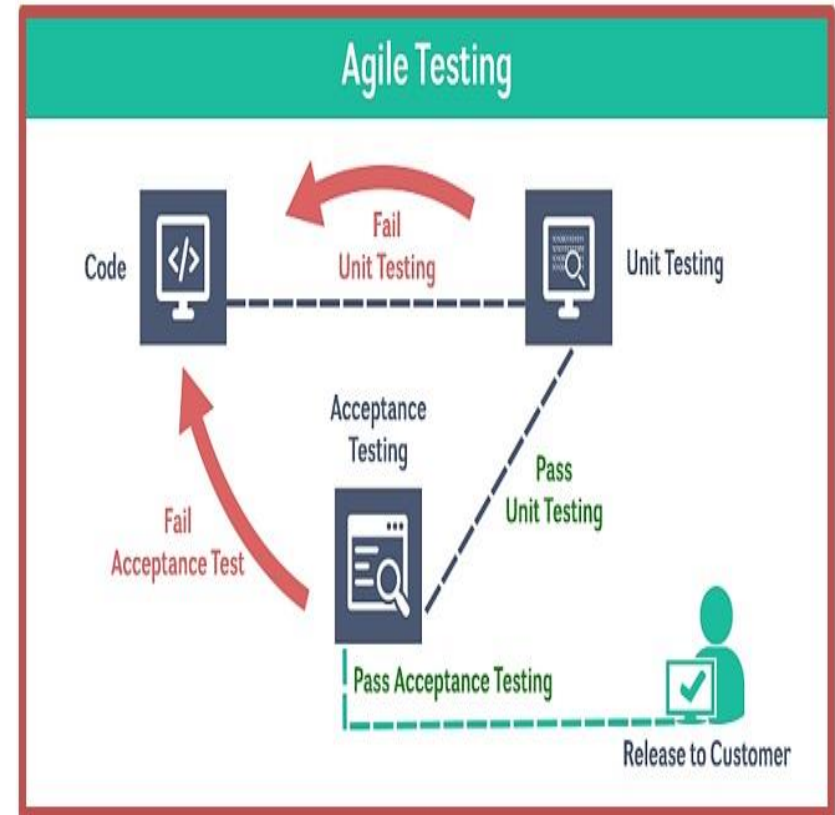

# In Agile,

- ☑ Every iteration has its own testing phase. It allows implementing regression testing every time new functions or logic are released.
- ☑ Agile Testing is not sequential but continuous.

# Agile Testing

- ☑ Testing as part of development process, rather than considering it as a different phase
- ☑ It is actively gets done throughout the programming phase

# In DevOps,

- ☑ Continuous Testing(CT)
- ☑ Process of executing automated tests as part of the software delivery pipeline.

# The Flow

# Testing Life Cycle

- ☑ System study
- ☑ Test plan
- ☑ Design test cases
- ☑ Execute test cases - Auto/Manual
- ☑ Report defects
- ☑ Regression test
- ☑ Analysis
- ☑ Summary reports

# Test Plan

- ☑ It is a systematic approach to test a software. The plan typically contains a detailed understanding of what the eventual testing workflow will be.

# Test Case

- ☑ It is a specific procedure of testing a particular requirement.
- ☑ It will include: Identification of specific requirement tested Test case success/failure criteria Specific steps to execute test Test data

# Technique

- ☑ White box Testing
- ☑ Black box Testing

# White box Testing

- ☑ Knowledge of the internal program design and code required.
- ☑ Testing are based on coverage of code.
- ☑ Doing by developers

# Black box Testing

- ☑ No Knowledge of internal program design or code required
- ☑ Testing are based on requirements and functionality
- ☑ Doing by Testers

# Levels of Testing

- ☑ Unit Testing
- ☑ Integration Testing
- ☑ System Testing
- ☑ User Acceptance Testing

# Unit Testing

- ☑ Test each module individually
- ☑ Done by developers
- ☑ Performed at the earliest stage of development process
- ☑ Follows a white box testing.

# Integration Testing

- ☑ For all modules unit tested, integration aims to test different parts of the system in combination.
- ☑ Identify errors associated with interfacing.
- ☑ Done by testers

# System Testing

- ☑ System testing is to uncover the requirement errors
- ☑ All system elements work properly and that overall system function and performance has been achieved.
- ☑ Done by Testing team [Alpha]
- ☑ Done by Friendly-customer[Beta]

# User Acceptance Testing

- ☑ To determine whether to accept or reject the delivery of the software.
- ☑ By Users

# Points for Unit Testing

## ☑ Functional

- ▶ Does the piece of code functionally perform the task.

## ☑ Boundaries

- ▶ What are the minimum and maximum value for function? What happens if they are not within the boundaries.

# Contd.,

## ☑ Termination

- ▶ What happens in the normal termination of the function?
- ▶ What about an abnormal termination of the function?. Will the application continue or will an error occur. Is the error trapped?

# Contd.,

## ☑ Output:

- ▶ What are the expected outputs of the function?
- ▶ Where do they go, what happens if the output is nothing?
- ▶ What happens if the output cannot be passed to next function?

# Contd.,

## ☑ Inputs:

- ▶ What are the expected inputs to the function?
- ▶ What happens if they do not get passed in?
- ▶ What happens if they are wrong type?

## ☑ Interactions:

- ▶ What other modules does this interact with? will those be effected by the change?

# Tester vs Developers

- ☑ Developer always wants to see his code working properly. So he will test it to check if its working correctly.
- ☑ Tester will test the application, to make it fail in any way and how application is not working correctly.

## Contd.,

- ☑ For Success of any project there should be a Testing team validation the applications.
- ☑ The Testers responsibility to make APPLICATION Smarter!!!

# Tester point of views

- ☑ Do your own acceptance tests.
- ☑ Do not REPEAT bugs
  - ▶ One bad thing that you may experience being a tester, is developer which repeats the same errors. This illustrates the CARELESSNESS of the programmer and his lack of progress in learning.

# Contd.,

- ☑ Testers do not want hurt developers
    - ▶ Developers often are afraid to give the code for testing, rather seek the assistance in order to ensure doing good job.
  - ☑ Write comments and human readable code
    - ▶ It will be useful in code review. In parallel, write code that explains a lot without reading the comments, function and variable names.
- [Standards Follow-ups]

# Contd.,

- ☑ Provide descriptive error alerts
  - ▶ Through the provision of good error messages , tester can provides ready information with bug.
- ☑ Do not Test the Tester
  - ▶ Never code for unwanted bugs to demonstrate the poor quality of tester. It always ends with client' expectations.

# Finally

- ☑ Have a good interaction,
- ☑ Take Responsibility,
- ☑ Understand the tasks,
- ☑ Close the bugs,
- ☑ And at last give the quality product.
- ☑ It Makes us to reach what we have aimed and also it reach our company to the top level.
